JavaScript – ES/JS, ES5, ES6, and ES7 features needed in React development and seen in many React examples.

The list of the ES features needed in React development. Some are even older than ES5 though...

See the Mozilla Developer Network for all of these!

Juhani Välimäki 2019-08-20

- let block scoped variable (Until ES6 we only had 'var' with only two possible scopes: function and global)
 https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Statements/let
- const block scoped <u>constant</u> (the first immediate value needs to be given right away and will be constant, e.g. the object reference. But the _contents_ of that object and so on are not protected by const!).
 https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Statements/const
- arrow functions (shorter syntax, implicit return, reference 'this' auto-bound to outer scope)
 https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Functions/Arrow functions
- .map method/function https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global Objects/Array/map
- .forEach function for many kind of collections
 https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/Array/forEach
 https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/Map/forEach
 https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/Set/forEach
- .filter method https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global Objects/Array/filter
- ES6 class syntax https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Statements/class
- ES6 class inheritance syntax
 https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Classes/extends
- template literals and placeholders (with backticks ` and \${ } to get rid of this kind of String concatenation clumsiness: "Hello"+name+"!")
 https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Template literals
- spread operator (spread notation/spread syntax) to make a 'deeper copy' of an object, instead of the 'totally shallow copy'. Copying goes one level deep = the properties of the original and copy object are separate. (But those separate properties may contain references to same objects)
 https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Operators/Spread_operator
- ES6 export and import from module to another (default or named)
 https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Statements/export
 - So after 2015 this version has been expanding in use:
 - in original.js export default someObj or export someObj;
 - in file using.js import myObj from './original';

or import {someObj as myObj} from './original';

- o (It replaced the older the CommonJS way: https://en.wikipedia.org/wiki/CommonJS)
 - (in original.js module.exports = someObject; // exposing someObject as/from module)
 - (in file using.js var copyOfSomeObject = require('/original.js'); // getting an instance of it)
- extra trailing comma(s) allowed at the end of ES6(?) lists etc. e.g. [1,2,3,] {name:"Joe",yob:1986,} foo(2,3,); https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Trailing commas
- Property accessor used so that its name is not hard-coded string, but comes from a variable:
 https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Operators/Object_initializer Scroll down to "Computed property names".

```
this.setState({[event.target.name]: event.target.value});
compare to this: this.setState({firstName: event.target.value});
```

if the event's target's name was string "firstName".

Juhani Välimäki 2019-08-20

- OLD JS: function parameter default values https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Functions/Default_parameters
- OLD JS: leaving arguments out is only allowed at the end of a function argument list while calling a function

```
That's why we need to write e.g. ( _ , index ) => key={index}>index
    where we are marking the skipped parameter with dummy name _ . That is counted as a parameter, but not needed/used. We need to write the _ as otherwise index would not be the second parameter like it needs to be. Similar use:

( _ => whatever_code_here )
```

- OLD JS: falsy values and them in type-coerced comparisons with only two equals signs ==
 https://developer.mozilla.org/en-US/docs/Glossary/Falsy
 https://developer.mozilla.org/en-US/docs/Glossary/Truthy
 https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Operators/Comparison_Operators#Equality ()
- short notation object literals of this kind: { a } which means same as { a : a}

https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Operators/Object_initializer#New_notations in ECMAScript_2015

In React JSX {{a}} means first going to JS mode using the outer { } and then having that shortened {a} object literal inside

- IIFE, SIAF, SEAF https://developer.mozilla.org/en-US/docs/Glossary/IIFE Learn the first example(s) here: https://developer.mozilla.org/en-US/docs/Glossary/IIFE#Examples
- Difference between JavaScript Object literals (=JavaScript code) and JSON (=Text, String in JS):
 https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Operators/Object_initializer#Object_literal_notation_vs_JSON

A new way of defining methods (Methods: object-attached functions, object's function members)
 https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Functions/Method_definitions#Description

Advanced features for the very highest grade(s):

- (A bit abstract and advanced) JavaScript closures
 https://developer.mozilla.org/en-US/docs/Web/JavaScript/Closures
- async functions with an implicit Promise and a possible await inside where e.g. AJAX call will be initiated, but then we start to wait for the answer at the await. The thread though is freed to do other stuff in the mean time: https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Statements/async_function
- ES6 **promises** (promise1.then(function2)) Easier to read handling of asynchronous function calls and their callbacks. https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/Promise
- (Smaller curiosity) JavaScript doesn't allow **identifiers starting with number**. But what if you get the JSON text {"123":"Yeah"} and parse it as an JavaScript object?

```
var a = JSON.parse('{"123":"Yeah"}');
console.log(a.123);  // Error, unexpected number
console.log(a."123");  // Error, unexpected String
console.log(a["123"]);  // ok, prints: Yeah
console.log(a[123]);  // ok, prints: Yeah
```

https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Operators/Object_initializer#Accessing_p_roperties

****** END ******

Juhani Välimäki 2019-08-20

Not in the 2019-02-04 exam: (Some of these just because they were not included yet, possibly will be in future exams)

OUT OF SCOPE: The items below in this list:

OUT OF SCOPE:

Most likely not in future exams either even if useful

• OUT OF SCOPE I: Intl API.

Going to the other exams:

- Ready-made React UI Components, like the react-table package.
- npm/yarn/create-react-app: After installing package check where everything went. (Related to npm/yarn/React, not just JS)
